## CONCRETE STAINING

Concrete has advantages as a superior floor/hard surface overlayment, both for a water barrier and for being durable and easy to clean. Concrete also holds potential to be very interesting in that it can be transformed to achieve wonderful organic, or almost alchemic changes in color. Acid staining a patio, lobby, shop, or basement floor is an unbelievable transformation from a dry grey slab of concrete. This process when coated with a polyaspartic or similar clear coating yields dramatic and organic patterns, and amazing variegated colors, unique to each slab and its individual mineral composition. Non-acid

dyes are used for a more uniform appearance of color. Bright colors, geometric patterns, logos and stamps and custom textures make the possibilities endless to create a one of a kind floor that will likely outlast any. From a natural weathered stone appearance to something more intentional, I have the experience to give you a stunning look with unmatched ease of maintenance.
